

**INTRODUCING Concentric Venting with Stainless Steel Inner**

The new FasNSeal Concentric Venting System is an economical, laser welded venting solution for appliances such as boilers, water heaters and air furnaces. It features a corrosion-resistant, super-ferritic stainless steel inner wall, paired with a zincalume outer wall that is paintable. Proprietary twist-lock connections make for a precise and tight seal by incorporating silicone O-rings on the inner wall and outer casing.

3" inner with 5" outer diameters. Multiple pipe lengths and extensions eliminate field pipe cutting. Custom adapters to transition from co-linear to coaxial are available.

A sealed, air-tight system that safely brings to the heating appliance outdoor air as combustion air.
